Abstracts

Desulfurization gypsum, also known as FGD gypsum (Flue Gas Desulfurization gypsum), is a synthetic gypsum produced as a byproduct of flue gas desulfurization in coal-fired power plants, where limestone or lime is used to scrub sulfur dioxide from exhaust gases, resulting in a calcium sulfate dihydrate material with chemical properties similar to those of natural gypsum but with consistent purity and minimal impurities. This material is primarily utilized in the construction industry as a key raw material for manufacturing gypsum plaster, wallboard, drywall, and cement, where it serves as a setting time regulator, and is also increasingly used in agricultural applications as a soil amendment to improve soil structure and provide sulfur and calcium nutrients. The market for desulfurization gypsum is driven by stringent environmental regulations mandating sulfur emissions reduction, the growing construction sector demanding sustainable building materials, and the push toward circular economy practices that valorize industrial byproducts, though it faces challenges such as logistical costs associated with transportation from power plants to end-users, competition from natural gypsum in regions where it is abundant and cheaper to mine, and potential variability in quality depending on the FGD process and coal source. Geographically, the market is prominent in regions with high coal power generation and strict environmental policies, such as China, the United States, and Europe, where recycling and utilization rates are high due to supportive regulations and developed infrastructure for byproduct management.

The global Desulfurization Gypsum market size was estimated at USD 2350.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
