Report Overview

Deuterium gas ($2H_2$; D_2) is used in the manufacturing of silicon semiconductors and microchips found commonly in circuit boards through the process of a deuterium-protium exchange. Deuterium annealing replaces the protium atoms with deuterium, preventing deterioration of the chip circuitry from chemical erosion and the Hot Carrier Effect. This process significantly extends and improves the life cycle of semiconductors and microchips, while allowing them to be made smaller and have high circuit densities (high density chips).
