Report Overview

Diabetes pump therapy, also known as insulin pump therapy, is an advanced and specialized method of managing diabetes mellitus, a chronic medical condition characterized by high levels of blood sugar (glucose). This therapy involves the use of a small electronic device called an insulin pump, which is typically worn externally and delivers a continuous and controlled supply of insulin into the body throughout the day. The pump closely mimics the function of the pancreas, which normally produces and releases insulin in response to changing blood sugar levels. Diabetes pump therapy offers individuals with diabetes a more flexible and precise way to regulate their blood glucose levels, allowing for better glycemic control and reducing the need for frequent manual insulin injections. It is often used by people with type 1 diabetes but can also benefit some individuals with type 2 diabetes who require insulin therapy.

The global Diabetes Pump Therapy market size was estimated at USD 3845.50 million in 2023 and is projected to reach USD 7069.79 million by 2032, exhibiting a CAGR of 7.00% during the forecast period.
