Report Overview

Diabetic retinopathy (DR) represents a major cause of visual impairment in developed countries. The ever-growing incidence of DR and its complications necessitates new strategies to screen patients, prevent complications and optimize management. For this reason, DR is a major target of AI-based models, especially those that can be used for large-scale screening. AI models should recognize DR-related alterations, such as haemorrhages, exudates, cotton wool spots and neovascularization; and, starting from fundus images, establish the presence or absence of DR, and grade it according to the conventional DR grading scales.
