Abstracts

Diamond polishing liquid is a specialized chemical suspension containing micron or sub-micron sized diamond particles dispersed in a liquid medium, often water or oil-based, designed for precision finishing of hard materials such as ceramics, semiconductors, glass, and metals. It functions as a lapping or polishing compound in mechanical and chemical-mechanical polishing (CMP) processes, where the abrasive diamond particles remove material at a microscopic level to achieve ultra-smooth, scratch-free surfaces with high dimensional accuracy and superior surface integrity. Its formulation typically includes stabilizers, surfactants, and pH adjusters to ensure uniform particle distribution, prevent sedimentation, and optimize polishing performance based on the material being processed and the desired surface finish.

The global Diamond Polishing Liquid market size was estimated at USD 248.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
