### Report Overview:

Diaphragm pump or Membrane pump, also known as pneumatic diaphragm pump or Air Operated Double Diaphragm Pump. A type of reciprocating pump, the pump is divided into two parts that are not connected with each other by elastic film, corrosion-resistant rubber or elastic metal sheet, which are the area where the liquid to be transported and the live column exist. In this way, the live column does not come into contact with the liquid being transported. The reciprocating motion of the live column is transmitted to the diaphragm through the medium on the same side, so that the diaphragm also reciprocates, so that the conveyed liquid can be sucked and discharged through the spherical valve. The only part in the diaphragm pump that is in contact with the liquid being conveyed is the ball valve, which is easily made in a liquid-proof form. In industrial production, diaphragm pumps are mainly used to transport corrosive liquids or liquids containing suspended solids.

The Global Diaphragm Pumps Market Size was estimated at USD 1095.51 million in 2023 and is projected to reach USD 1700.16 million by 2029, exhibiting a CAGR of 7.60% during the forecast period.
