Abstracts

Diaphragm walling grabs are specialized excavation tools used in the construction industry for creating deep, narrow trenches known as diaphragm walls, which are typically filled with concrete to form structural elements such as retaining walls, cut-off walls, or foundations for high-rise buildings and infrastructure projects. These grabs, which can be mechanical or hydraulic, operate by repeatedly opening and closing their clamshell-like jaws to remove soil and other materials, enabling precise and efficient excavation in challenging ground conditions, including below the water table. As critical components in diaphragm walling rigs, they are designed for durability, high performance, and the ability to handle a variety of soil types, from soft clays to harder rock formations, making them indispensable in modern geotechnical engineering and large-scale civil construction.

The global Diaphragm Walling Grabs market size was estimated at USD 310.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.65% during the forecast period.
