Abstracts

A die attach carrier substrate is a critical component in semiconductor packaging, serving as an intermediate platform that physically supports and electrically connects a semiconductor die to a larger substrate or printed circuit board (PCB), typically using materials such as ceramics, organic laminates, or metal cores to ensure thermal management, mechanical stability, and signal integrity during assembly and operation. The market for these substrates is driven by the expanding semiconductor industry, particularly in advanced packaging technologies like 2.5D/3D IC integration, fan-out wafer-level packaging (FOWLP), and system-in-package (SiP) solutions, where demand for higher performance, miniaturization, and thermal efficiency in applications ranging from consumer electronics and automotive to telecommunications and high-performance computing is accelerating. Key market trends include the adoption of materials with enhanced thermal conductivity, such as aluminum nitride and direct bonded copper (DBC), as well as innovations in design for improved electrical performance and reliability under harsh operating conditions, while regional growth is concentrated in Asia-Pacific due to the strong presence of semiconductor fabrication and packaging hubs in countries like China, Taiwan, and South Korea, though supply chain complexities and rising material costs present ongoing challenges.

The global Die Attach Carrier Substrate market size was estimated at USD 420.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
