Report Overview

Diet food (or dietetic food) refers to any food or beverage whose recipe is altered to reduce fat, carbohydrates, and/or sugar in order to make it part of a weight loss program or diet. Such foods are usually intended to assist in weight loss or a change in body type, although bodybuilding supplements are designed to aid in gaining weight or muscle.

Within the U.S. market, the marketing and consumption of diet foods takes place in the context of a national obesity crisis. Obesity in the United States has risen steadily for half a century, and at epidemic rates during the most recent decades. Hundreds of thousands of U.S. adult deaths each year are attributable to unhealthy dietary habits, as well as health problems caused by physical inactivity and sedentary behavior, such that obesity ranks as a leading cause of preventable death in United States. Obesity is found worldwide, of course, but the prevalence of these conditions in the United States ranks at the highest levels among developed nations.
