Report Overview

The multi-frequency dielectric loss tester is an instrument used to measure the dielectric loss of electronic components (such as capacitors, inductors, filters, etc.) at different frequencies. Dielectric loss refers to the energy loss caused by the medium (such as dielectric) in electronic components under the action of an electric field or a magnetic field. It is usually expressed as the tangent value of the loss angle. The multi-frequency dielectric loss tester can evaluate the performance and quality of electronic components by measuring the capacitance value, inductance value and loss tangent value of electronic components at different frequencies. It usually uses high-precision testing technology and calculation methods to quickly and accurately measure the dielectric loss of electronic components at multiple frequency points, thereby helping engineers in circuit design, component selection, and quality control.

The global Different Frequency Dielectric Loss Tester market size was estimated at USD 85.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
