Report Overview

A differential probe is used to look at signals that are referenced to each other instead of earth ground and to look at small signals in the presence of large DC offsets or other common mode signals such as power line noise. A differential probe can be used to make single-ended measurements by using its negative input as a ground reference contact and there are several advantages to using a differential probe to make single ended measurement action. Differential probes are especially popular for measuring high-frequency signals or signals where neither are referenced to ground.
