Abstracts

Differential refractometers are analytical instruments that measure the difference in refractive index between a sample solution and a reference solvent, providing highly precise data used primarily to determine concentrations of solutes, monitor chemical reactions, analyze molecular interactions, and characterize polymers or biomolecules in fields such as pharmaceuticals, biotechnology, food science, and chemical manufacturing. These devices operate based on the principle that the refractive index of a solution changes in proportion to the concentration of dissolved substances, enabling quantitative analysis without the need for labels or dyes, and are often integrated into high-performance liquid chromatography (HPLC) systems for detection and purification applications.

The global Differential Refractometers market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
