The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Difunctional Aliphatic Urethane Methacrylate competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Difunctional Aliphatic Urethane Methacrylates are a class of photocurable resin prepolymers with aliphatic diisocyanates (such as HDI and IPDI) and diols as the main chain, incorporating methacrylate functional groups through end-group capping reactions. The upstream of the industry chain mainly includes basic chemical raw materials such as aliphatic diisocyanates (such as HDI and IPDI), polyether or polyester diols, and hydroxyethyl methacrylate (HEMA). These compounds possess the toughness and flexibility of aliphatic polyurethanes, as well as the rapid curing characteristics of methacrylates, and are therefore often used as key components in UV-curable coatings, inks, adhesives, and 3D printing materials. Global sales in 2024 were approximately 3,000 tons, with an average market price of about US\$16 per kilogram. The size of a single production line varies depending on the production process and the investment scale of the production equipment. The industry's gross profit margin ranges from 15% to 25%.

The global Difunctional Aliphatic Urethane Methacrylate market size was estimated at USD 48.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
