Abstracts

Digital cell sorting systems are advanced laboratory instruments that employ technologies such as fluorescence-activated cell sorting (FACS) or microfluidics to isolate specific cell populations from heterogeneous samples based on predefined characteristics like size, granularity, or biomarker expression. These systems enable high-throughput, automated separation of cells with high purity and viability, and are integral to applications in biomedical research, drug discovery, clinical diagnostics, and cell therapy development. By combining precise detection mechanisms?often using lasers and optical sensors?with sophisticated software for data analysis and sorting decision-making, digital cell sorting systems provide researchers and clinicians with reproducible, efficient tools to obtain highly purified cell subsets for downstream analysis or therapeutic use.

The global Digital Cell Sorting System market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
