## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Digital Geophone competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A digital geophone is a seismic sensor that converts ground motion (velocity or acceleration) directly into a digital output signal. It integrates the sensing element and analog-to-digital conversion (ADC) circuitry in the same housing. While traditional analog geophones generate an analog voltage proportional to ground velocity, requiring external digitization, digital geophones output a discrete digital signal, enabling high-fidelity, noise-resistant data transmission over long distances. Digital geophones are widely used in oil and gas exploration, seismic monitoring, structural health assessment, and permanent reservoir monitoring due to their high dynamic range, excellent linearity, and immunity to electromagnetic interference. In 2024, global digital geophone production will reach 52,800 units, with an average selling price of US\$1,629 per unit.

The global Digital Geophone market size was estimated at USD 86.03 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
