### Report Overview

A digital holographic microscope (DHM) is a type of optical microscope that uses the principle of holography to produce three-dimensional images of microscopic objects. Holography is a technique that records the interference pattern of two coherent light beams, one reflected by the object and one acting as a reference. The recorded hologram can then be reconstructed by illuminating it with the same reference beam, creating a virtual image of the object that preserves its amplitude and phase information. A DHM uses a digital camera to capture the hologram and a computer to process and display the image. A DHM can provide quantitative and qualitative information about the shape, size, thickness, refractive index, and optical properties of the object, as well as its dynamic behavior and interactions .
