Abstracts

Digital identification refers to the technological framework and systems used to verify and authenticate the identity of individuals or entities in digital environments, encompassing a wide range of solutions such as biometric verification, digital certificates, secure tokens, and blockchain-based credentials, which collectively enable secure access to services, transactions, and data while mitigating risks associated with fraud, identity theft, and unauthorized access in an increasingly interconnected and digitized global economy. The market for digital identification is expanding rapidly due to heightened cybersecurity concerns, regulatory mandates for stronger identity verification (such as Know Your Customer and Anti-Money Laundering requirements), and the growing adoption of digital services across industries including finance, healthcare, government, and e-commerce, with key drivers including the proliferation of smartphones, advancements in artificial intelligence and machine learning for identity validation, and the rising demand for seamless yet secure user experiences, while challenges involve issues of privacy, data protection, interoperability between systems, and the need to balance security with user convenience.
