Report Overview:

A laser rangefinder is a rangefinder which uses a laser beam to determine the distance to an object, which has been in use as early as the introduction of lasers; it is a useful optical method for measuring distance. LRF is based on time-of-flight method, and it employs light waves. This technique is based on a transmission of a short pulse of electromagnetic radiation and the reception of back scattered signals from a target. The precision of the instrument is determined by the rise or fall time of the laser pulse and the speed of the receiver. One that uses very sharp laser pulses and has a very fast detector can range an object to within a few millimetres.

The Global Digital Laser Rangefinder Market Size was estimated at USD 1512.38 million in 2023 and is projected to reach USD 2522.49 million by 2029, exhibiting a CAGR of 8.90% during the forecast period.
