Report Overview:

DLP (Digital Light Processing) is a similar process to stereolithography in that it is a 3D printing process that works with photopolymers. The major difference is the light source. DLP uses a more conventional light source, such as an arc lamp with a liquid crystal display panel, which is applied to the entire surface of the vat of photopolymer resin in a single pass, generally making it faster than SL. Also like SL, DLP produces highly accurate parts with excellent resolution, but its similarities also include the same requirements for support structures and post-curing. However, one advantage of DLP over SL is that only a shallow vat of resin is required to facilitate the process, which generally results in less waste and lower running costs.

The Global Digital Light Processing (DLP) 3D Printing Technology Market Size was estimated at USD 753.60 million in 2023 and is projected to reach USD 1229.48 million by 2029, exhibiting a CAGR of 8.50% during the forecast period.
