Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Digital MEMS Accelerometer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The Digital MEMS Accelerometer is a solid-state sensor based on Micro-Electro-Mechanical Systems (MEMS) technology, which converts inertial forces into quantifiable electrical signals through the displacement or deformation of micro-structured proof masses under acceleration, utilizing capacitive, piezoresistive, or thermal detection principles, and outputs digital values via an on-chip analog-to-digital conversion module. Its design employs micro/nano-scale integration processes, offering low power consumption, high integration, and shock resistance to accurately sense three-axis linear acceleration changes. The digital output mode eliminates noise interference in analog signal transmission, making it suitable for applications requiring high dynamic response and long-term stability, such as inertial navigation, attitude control, and industrial equipment vibration monitoring, particularly in miniaturized and embedded systems.

The global Digital MEMS Accelerometer market size was estimated at USD 361.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.40% during the forecast period.
