## Abstracts

Digital microwave communication refers to the transmission of digital signals over microwave frequencies, typically used for point-to-point communication links in telecommunications, broadcasting, and data networking. It involves using microwave radio waves (typically in the frequency range of 1 GHz to 100 GHz) to carry data, voice, or video signals between two fixed locations. This technology is widely used for wireless backhaul in mobile networks, satellite communication, and high-speed internet connections, offering high capacity, low latency, and reliability over long distances. Digital microwave communication systems convert data into digital format, modulate it onto microwave signals, and transmit it through line-of-sight (LOS) links. It is especially valuable in areas where laying physical cables is impractical or too expensive.

The global Digital Microwave Communication market size was estimated at USD 2250.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
