Report Overview:

Night vision cameras often use infrared, because low light imaging used by night vision cameras is not clear enough and cannot provide long-distance detecting in total darkness at night, but infrared cameras can. The biggest advantage of infrared cameras is that it is much better at spotting and tracing objects. Visible light devices and night vision cameras with low light imaging cannot see the target hidden in the grass or forest. However, with infrared cameras, the infrared radiation of the targets which stands for heat would go through the covering material and can be clearly seen.
