Abstracts

The Digital Onboarding Platform is an integrated solution that uses digital processes to help users or employees complete initial onboarding, including account registration, identity verification, agreement signing, and information collection. Its core purpose is to replace traditional offline processes and achieve "zero-contact" and efficient onboarding. AI technology is widely used in digital onboarding platforms. For example, AI is used to automatically identify information such as ID cards, educational backgrounds, and bank account information, with increasing accuracy. Furthermore, AI predictive models can provide early warnings for employees at high risk of leaving, helping companies better manage their human resources. To ensure data security, encryption using national secret algorithms and quantum key distribution (QKD) technologies are widely adopted, and zero-trust architecture has become standard. Furthermore, dynamic desensitization features can hide sensitive information, reducing the risk of information leakage. Digital onboarding platforms break down system silos through API integration and low-code platforms, enabling integration with other systems and improving data liquidity and business process continuity.

The global Digital Onboarding Platform market size was estimated at USD 2153.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.30% during the forecast period.
