Report Overview

A Digital PET-CT scanner is a medical imaging device that combines the functional imaging capabilities of a Positron Emission Tomography (PET) scanner with the anatomical imaging capabilities of a Computed Tomography (CT) scanner. The scanner is used to generate images of the body that can help in the diagnosis and treatment of various diseases, including cancer, heart disease, and neurological disorders. Unlike traditional PET scanners, which use analog photomultiplier tubes to detect gamma rays emitted from a patient's body, digital PET scanners use silicon photomultiplier detectors, which offer higher sensitivity and resolution. This allows for more precise localization of the radioactive tracer used in PET imaging, which in turn allows for more accurate detection and diagnosis of diseases.

The global Digital PET-CT Scanner market size was estimated at USD 1523 million in 2023 and is projected to reach USD 4991.96 million by 2032, exhibiting a CAGR of 14.10% during the forecast period.

North America Digital PET-CT Scanner market size was estimated at USD 498.57 million in 2023, at a CAGR of 12.09% during the forecast period of 2024 through 2032.
