Report Overview:

A Digital PET-CT scanner is a medical imaging device that combines the functional imaging capabilities of a Positron Emission Tomography (PET) scanner with the anatomical imaging capabilities of a Computed Tomography (CT) scanner. The scanner is used to generate images of the body that can help in the diagnosis and treatment of various diseases, including cancer, heart disease, and neurological disorders. Unlike traditional PET scanners, which use analog photomultiplier tubes to detect gamma rays emitted from a patient's body, digital PET scanners use silicon photomultiplier detectors, which offer higher sensitivity and resolution. This allows for more precise localization of the radioactive tracer used in PET imaging, which in turn allows for more accurate detection and diagnosis of diseases.

The Global Digital PET-CT Scanner Market Size was estimated at USD 1740.66 million in 2023 and is projected to reach USD 3840.85 million by 2029, exhibiting a CAGR of 14.10% during the forecast period.
