Abstracts

Digital photogrammetry is a technique that uses overlapping photographs captured from different positions to extract precise three-dimensional measurements and geometric information of objects or terrain through computational algorithms, relying on principles of triangulation and stereoscopy to reconstruct spatial data without physical contact. The process typically involves capturing images via cameras mounted on drones, aircraft, satellites, or ground-based systems, followed by software-driven processing to generate outputs such as orthomosaics, digital elevation models (DEMs), 3D point clouds, and textured meshes, making it a core technology in applications ranging from topographic mapping and urban planning to cultural heritage preservation and industrial inspection.

The global Digital Photogrammetry market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
