Abstracts

The digital shipyard is a modern shipbuilding model that uses advanced digital technologies such as the Internet of Things, big data, artificial intelligence, cloud computing, and digital twins to deeply integrate and intelligently upgrade the entire process of ship design, construction, management, and operation and maintenance. It is data-driven and realizes the digitalization and intelligence of the entire process from three-dimensional collaborative design, virtual simulation verification, intelligent production scheduling, automated robot welding/painting, real-time quality monitoring, transparent supply chain management, to predictive equipment maintenance. It aims to significantly improve shipbuilding efficiency, product quality, resource utilization, and safety production level, and is the core carrier for the transformation of the shipbuilding industry to high-end, lean, and green. Digital Shipyard is an innovative trend in the shipbuilding industry under the development of informatization and intelligence in recent years. With the rapid development of science and technology, especially the widespread application of technologies such as the Internet of Things, big data, artificial intelligence, cloud computing and industrial Internet, the traditional shipbuilding process is shifting towards a more intelligent and automated direction. Digital shipyards not only improve the accuracy and efficiency of shipbuilding, but also improve the transparency and traceability of various links such as production, operation and maintenance of shipyards through data management, thereby reducing operating costs, improving product quality, and shortening delivery cycles. At present, the global shipbuilding industry is in a period of transformation. Many shipyards have begun to combine digital technology with traditional shipbuilding, using advanced tools such as 3D printing, automated welding, digital design and manufacturing systems to improve productivity. For example, digital shipyards can simulate the design and production process of ships in advance through virtual simulation technology, optimize design solutions, and reduce errors in design and production. In addition, using digital monitoring and data analysis,

shipyards can track the progress of shipbuilding in real time, conduct quality control, and ensure the accurate delivery of products.

The global Digital Shipyard market size was estimated at USD 7801.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 22.90% during the forecast period.
