Abstracts

Mixed metal oxide (MMO) electrodes, also called Dimensionally Stable Anodes (DSA), are devices with high conductivity and corrosion resistance for use as anodes in electrolysis. They are made by coating a substrate, such as pure titanium plate or expanded mesh, with several kinds of metal oxides. One oxide is usually RuO₂, IrO₂, or PtO₂, which conducts electricity and catalyzes the desired reaction such as the production of chlorine gas. The other metal oxide is typically titanium dioxide which does not conduct or catalyze the reaction, but is cheaper and prevents corrosion of the interior.

The global Dimensionally Stable Anode market size was estimated at USD 442.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
