### Report Overview

Dimming film is a new type of electronic light-controlling product, which is a composite of liquid crystal / polymer composite material between two flexible ITO transparent conductive films. It consists of PET polyester resin, flexible ITO transparent conductive film, PDLC polymer dispersed liquid crystal molecules, flexible ITO transparent conductive film, and PET polyester resin, which can be adjusted to a transparent and atomized (light-transmitting but not transparent) state, that is, in the absence of an electric field. In the case of liquid crystal, the liquid crystal / polymer mixed material in the middle of the dimming film will show an irregular and disorderly arrangement so that it will form a light-transmitting and opaque atomized state. When a current is passed in, the liquid crystal / polymer mixed material will achieve Orderly arrangement. At this time, the dimming film will be converted from the atomized state to the transparent state.

Dimming heat-insulation film not only has the excellent changing characteristics of ordinary switchable films, but also has a very good heat insulation effect. Dimming heat-insulation film simultaneously blocks infrared, visible light and ultraviolet rays through reflection, conduction and absorption to achieve a balance between heat insulation effect and visual clarity.
