Abstracts

Diode lasers in dentistry refer to a type of laser technology used by dentists for various procedures due to their precision and versatility. These lasers emit light in the infrared spectrum, often around 810 to 980 nanometers, which makes them suitable for soft tissue applications in dentistry.

Market Drivers: Advancements in Technology: Ongoing advancements in diode laser technology, including improvements in wavelength options, power output, and versatility, drive the adoption of these lasers in dental practices.

Treatment Precision and Versatility: Diode lasers offer precise tissue cutting, coagulation, and disinfection abilities, making them versatile for various soft tissue procedures in dentistry, such as gum surgery, lesion removal, and periodontal treatments.

Patient Comfort and Experience: Diode lasers often provide a more comfortable experience for patients due to reduced pain, minimal bleeding, and faster healing times compared to traditional surgical methods, leading to increased patient satisfaction.

Market Restrictions: Cost of Implementation: The initial cost of acquiring diode laser equipment and the required training for dental practitioners can be a significant barrier for some practices, limiting widespread adoption.

Training and Expertise: Adequate training and expertise are necessary for safe and effective use of diode lasers. Not all dental professionals may have the necessary skills, leading to limitations in their adoption.

Market Fragmentation and Competition: The presence of various manufacturers offering different models and specifications of diode lasers could lead to market fragmentation and variability in quality, making it challenging for practitioners to choose the most suitable option.

The global Diode Laser for Dentists market size was estimated at USD 105.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
