Abstracts

Diphenoxylate hydrochloride is a synthetic opioid medication primarily used in combination with atropine to treat acute and chronic diarrhea by slowing intestinal motility through its action on opioid receptors in the gut. It is classified as a Schedule V controlled substance in many countries due to its potential for dependence and abuse, though its formulation with atropine (which causes unpleasant side effects at higher doses) serves as a deterrent to misuse. Market dynamics are influenced by factors such as the prevalence of gastrointestinal disorders, regulatory policies governing opioid prescriptions, competition from alternative antidiarrheal agents (e.g., loperamide), and the availability of over-the-counter options. The pharmaceutical landscape includes both branded and generic versions, with demand driven by clinical need balanced against concerns regarding opioid stewardship and shifting prescribing practices.

The global Diphenoxylate Hydrochloride market size was estimated at USD 125.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 2.50% during the forecast period.
