Abstracts

A direct acting relief valve is a pressure control device designed to automatically open and discharge fluid when system pressure exceeds a preset threshold, thereby protecting downstream equipment from overpressure conditions; it operates through a simple mechanical principle where system pressure directly acts against a spring-loaded poppet or piston, requiring no external pilot signal or auxiliary power source, making it a self-contained, fail-safe component commonly used in hydraulic systems, pneumatic applications, and process industries where reliability, rapid response, and compact design are critical.
