Abstracts

Direct Coat IR Glazing refers to a specialized type of glass coating applied directly onto window surfaces to enhance infrared (IR) radiation reflection, thereby improving thermal insulation and energy efficiency in buildings. This technology functions by selectively reflecting heat-generating IR wavelengths while allowing visible light transmission, reducing solar heat gain and lowering cooling demands in warm climates. Unlike aftermarket films or laminated solutions, direct coat IR glazing is integrated during the glass manufacturing process, offering durability, uniformity, and long-term performance without compromising optical clarity. It is commonly used in commercial and residential construction to meet green building standards, enhance occupant comfort, and decrease reliance on HVAC systems.

The global Direct Coat Ir Glazing market size was estimated at USD 180.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
