Abstracts

A direct current (DC) arc detector is a safety-critical electronic device designed to identify and interrupt hazardous electrical arcing in DC power systems, which can occur due to insulation degradation, loose connections, or environmental factors. These detectors use advanced sensing technologies?such as light, radio frequency (RF) noise, or current signature analysis?to rapidly detect the unique characteristics of an arc event, then trigger protective mechanisms like circuit interruption to prevent fires, equipment damage, or personal injury. Especially vital in high-power DC applications such as solar photovoltaic arrays, battery energy storage systems, electric vehicle charging infrastructure, and data centers, these devices address the heightened risks associated with DC arcs, which do not self-extinguish like AC arcs and thus require specialized, fast-acting detection and mitigation solutions to ensure system safety and compliance with evolving industry standards.

The global Direct Current Arc Detector market size was estimated at USD 48.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
