Report Overview:

A circuit breaker is an automatically operated electrical switch designed to protect an electrical circuit from damage caused by overload or short circuit. Its basic function is to detect a fault condition and interrupt current flow. Unlike a fuse, which operates once and then must be replaced, a circuit breaker can be reset (either manually or automatically) to resume normal operation. Circuit breakers are made in varying sizes, from small devices that protect an individual household appliance up to large switchgear designed to protect high voltage circuits feeding an entire city.

DC circuit breaker is used for the protection of electrical devices that operate with direct current. The main difference between direct current and alternating current is that in DC the voltage output is constant, while in AC it cycles several times per second.

The Global Direct Current (DC) Circuit Breakers Market Size was estimated at USD 2540.60 million in 2023 and is projected to reach USD 3123.04 million by 2029, exhibiting a CAGR of 3.50% during the forecast period.
