Report Overview

A direct drive linear motor is a type of linear motor that directly drives the load without the need for intermediate mechanical components like belts, gears, or lead screws. It consists of two main components: a stationary part (stator) and a moving part (forcer). The stator contains a series of coils that generate a magnetic field when an electric current passes through them. The forcer, typically made of a magnet or magnets, is attached to the load and moves along the length of the stator. The interaction between the magnetic field of the stator and the magnetic field of the forcer creates the linear motion.
