Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Direct Drive Linear Motor Positioner competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Direct drive linear motor positioner is a positioning device that directly drives the slide table through a linear motor without an intermediate transmission mechanism to achieve high-precision and high-response linear displacement control. This positioner abandons the traditional screw or belt structure and adopts a permanent magnet synchronous linear motor as the drive source. With high-precision feedback systems such as grating scales, magnetic gratings or laser interferometers, it can achieve nanometer-level resolution and sub-micron-level repeat positioning accuracy. The dynamic response time is extremely short and it is suitable for high-speed, high-precision processing or detection scenarios. It is commonly used in semiconductor packaging, FPD panel alignment, laser micromachining, nano-level micro-manipulation and precision automated assembly. Typical parameters include effective travel range (from tens of millimeters to thousands of millimeters), maximum acceleration (up to 10G), load capacity (several kilograms to tens of kilograms) and positioning accuracy (within $\pm 0.1 \mu\text{m}$). Since there are no mechanical transmission parts, the direct drive structure can effectively reduce system friction, extend life, and has excellent speed tracking capabilities and extremely low system vibration. It is one of the core components for realizing modern intelligent manufacturing and precision control.

The global Direct Drive Linear Motor Positioner market size was estimated at USD 1511.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
