Report Overview

A direct drive wheel differs from other racing wheels by mounting the internal motor directly to the motor shaft. In comparison, other racing wheels utilise smaller motors with a series of gears or belts which link the motor to the steering wheel. When you add gears or belts in between the motor and the steering wheel, you will always muddy the force feedback detail. This is because you are adding moving parts which will interfere with the force feedback. By mounting the steering wheel directly to the motor and removing any gears or belts, you get the clearest force feedback sent directly through the motor shaft and into the steering wheel. This makes the force feedback created by direct drive wheels much more detailed, and in most cases stronger. Direct drive wheels often utilise larger, more powerful motors which are capable of producing stronger forces.
