Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Direct Imaging (DI) System for PCB competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A Direct Imaging (DI) system for printed circuit boards (PCBs) is an advanced photolithography technology that replaces traditional photomask-based exposure by using digitally controlled light sources, such as UV lasers or LEDs, to project circuit patterns directly onto photoresist-coated PCB substrates. This maskless process enables rapid design changes, higher alignment accuracy, and finer feature resolution, making it ideal for high-density interconnect (HDI), flexible circuits, and advanced packaging applications. DI systems enhance production efficiency by eliminating the need for film and reducing setup time, while also improving yield and reducing costs in modern PCB manufacturing.

The global Direct Imaging (DI) System for PCB market size was estimated at USD 562.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
