Abstracts

Direct-injection plasma surface treatment machine is an industrial equipment that uses atmospheric pressure plasma technology to efficiently modify the surface of materials. Its core principle is to ionize gas through a high-voltage electric field or a high-frequency power supply to generate highly active plasma, and directly spray it onto the surface of the material through a special nozzle, using physical bombardment and chemical reactions to remove pollutants, increase surface roughness or introduce polar groups, thereby significantly improving the adhesion, wettability or biocompatibility of the material. The equipment does not require a vacuum environment and can be directly integrated into the production line. It has the characteristics of fast processing speed, low energy consumption, environmental protection and safety.

The global Direct Injection Plasma Surface Treatment Machine market size was estimated at USD 157.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
