## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Direct-Light-Triggered Thyristors competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global output of Direct-Light-Triggered Thyristors was approximately 2.1 million units, with a production capacity of about 2.6 million units. The average unit price is about USD 410, achieving an average gross margin of 37%. Direct-Light-Triggered Thyristors (LTTs) are high-power semiconductor switching devices that can be directly activated by a laser or optical signal without the need for an electrical gate drive circuit. They are a subtype of thyristors used in pulsed power systems, high-voltage DC transmission (HVDC), and solid-state circuit breakers. LTTs integrate a photosensitive layer within the thyristor's gate structure, allowing optical triggering that reduces electromagnetic interference and enhances switching precision and reliability. The supply chain begins upstream with suppliers of silicon wafers, epitaxial layers, and diffusion or ion implantation materials. Midstream manufacturing involves wafer processing, photolithography, and assembly of optical triggering modules, typically by semiconductor device manufacturers. Downstream, these thyristors are incorporated into power electronics systems for energy transmission, industrial drives, and grid control applications by OEMs.

The global Direct-Light-Triggered Thyristors market size was estimated at USD 870.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
