## Abstracts

A direct stabilized platform refers to a system that uses a gyroscope to measure the spatial angular velocity of a carrier or platform load, so that the platform load can isolate the disturbance of the carrier and achieve stability in the inertial space. In this platform, the gyroscope is usually installed on the inner frame to be sensitive to the rate signal under the combined action of the frame movement and the carrier disturbance. Direct stabilized platforms are widely used in many fields due to their simple control and high stability accuracy, such as ship anti-roll devices and optoelectronic pod stabilization systems. However, since the gyroscope is installed on the inner frame, this also limits the development of miniaturization and fast response of the stabilized platform.

The global Direct Stabilized Platform market size was estimated at USD 346.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
