Abstracts

Direct-to-Chip Cooling Distribution Unit is a device specially designed for data center cooling. It achieves efficient heat dissipation by delivering coolant directly to the hotter components of the server (such as the CPU or GPU). The unit is usually located above the heat-generating components of the wiring board and absorbs and removes the heat from the chip through a single-phase cold plate or a two-phase cold plate. These cooling technologies can remove about 70-75% of the heat generated by the equipment in the rack, and the remaining heat may be removed through air cooling systems or other means.

The global Direct-to-Chip Cooling Distribution Unit market size was estimated at USD 513.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.40% during the forecast period.
