Abstracts

A directional speaker system, also known as a parametric or ultrasonic speaker, is an audio device that projects sound in a narrow, focused beam rather than dispersing it omnidirectionally, utilizing the nonlinear interaction of ultrasonic waves in air to generate audible sound only along a specific path, enabling targeted audio delivery to individual listeners or zones without spillover to surrounding areas. These systems are characterized by their ability to create private auditory experiences in public spaces, control acoustic pollution, and enhance user immersion by localizing sound precisely where it is intended, making them distinct from conventional speakers in both technology and application.

The global Directional Speaker System market size was estimated at USD 120.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.30% during the forecast period.
