## Abstracts

There are some limiting factors in the application and development of directly buried insulated pipelines. First of all, the selection and use of insulation materials are subject to certain restrictions. At present, thermal insulation materials mainly include polyurethane, silicate, glass fiber, etc. These materials have certain limitations in thermal insulation performance, environmental protection performance, durability and other aspects. At the same time, there are also some problems in the production and use of insulation materials, such as environmental pollution during the production process and potential safety hazards during use. Secondly, the construction and installation requirements of insulated pipes are relatively high. The installation of directly buried insulated pipes requires on-site welding, connection, assembly and other work, which requires high skills and experience of workers. At the same time, safety issues need to be paid attention to during the construction process, such as preventing high temperature burns and electric shock. In addition, the maintenance and management of insulated pipes is also an important issue. Insulated pipes require regular maintenance and inspection during use, such as checking whether the insulation material is damaged, checking whether the pipes are leaking, etc. In addition, there are some issues that need to be paid attention to when using insulated pipelines, such as preventing overloading and preventing high temperatures, to avoid damage to the pipelines and potential safety hazards. Finally, the price of directly buried insulated pipes is also a factor to consider. The price of insulated pipes is affected by many factors, such as material prices, installation costs, maintenance costs, etc. When selecting and using insulated pipes, comprehensive considerations need to be made based on the actual situation to select appropriate insulated pipes.

The global Directly Buried Insulated Pipes market size was estimated at USD 6413.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of

5.70% during the forecast period.
