Abstracts

Disc filtration systems are a type of mechanical filtration technology that utilizes a stack of grooved polypropylene discs to physically separate suspended solids from liquids. When the discs are compressed, the grooves align to form channels of a specific micron rating that trap particles while allowing clean fluid to pass through; during backwashing, the discs decompress and rotate to flush out accumulated debris, restoring filtration capacity with minimal water or energy consumption. These systems are widely used across industries such as municipal water and wastewater treatment, agriculture (particularly for micro-irrigation and fertigation), food and beverage processing, industrial manufacturing, and mining, where consistent, efficient removal of sediments, algae, organic matter, and other particulates is required for process reliability, equipment protection, and regulatory compliance.

The global Disc Filtration System market size was estimated at USD 1050.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
