Report Overview

Discrete manufacturers are typically ETO (engineer-to-order), which includes make-to-stock (MTS), make-to-order (MTO), and assemble-to-order (ATO) production facilities. Because each product manufacturer is unique, often requiring on-going modifications and engineering during the manufacturing process, there is a strong requirement for synchronized planning, scheduling, execution management and tracking capabilities. Without this alignment and monitoring, operations may degrade and erode profitability. Discrete manufacturing is a type of manufacturing process in which components are assembled to create individual finished goods. These types of products are made up of many individual parts, the total number of which may often reach tens of thousands. For example, in the case of cars, agricultural or military equipment, computer servers, etc. To designate all the individual parts that a product consists of and enable the effective management of their inventory, discrete manufacturers rely on using bills of materials (BOMs). If the sub-assemblies that an end-product is made of require prior assembly as well, layered or multi-level BOMs are used to keep track of the complexity.

The global Discrete Industry Wireless Automation market size was estimated at USD 739 million in 2023 and is projected to reach USD 1756.83 million by 2032, exhibiting a CAGR of 10.10% during the forecast period.
