Report Overview

In optical fiber communications, dispersion compensation modules (DCM) (also called dispersion compensation units, DCU) can be used for compensating the chromatic dispersion of, e.g., a long span of transmission fiber. Typically, such a module provides a fixed amount of dispersion (e.g. normal dispersion in the 1.6- μ m spectral region, with some wavelength dependence of the group delay dispersion), although tunable dispersion modules are also available. A module can easily be inserted into a fiber-optic link because it has fiber connectors for the input and output. The insertion losses may be significant, but may be compensated with a fiber amplifier, e.g. an erbium-doped fiber amplifier in a 1.5- μ m telecom system. A dispersion-compensating module is often placed between two fiber amplifiers.

The global Dispersion Compensation Fiber Modules market size was estimated at USD 74.60 million in 2023 and is projected to reach USD 108.97 million by 2032, exhibiting a CAGR of 4.30% during the forecast period.

North America Dispersion Compensation Fiber Modules market size was estimated at USD 20.90 million in 2023, at a CAGR of 3.69% during the forecast period of 2024 through 2032.
