Abstracts

In optical fiber communications, dispersion compensation modules (DCM) (also called dispersion compensation units, DCU) can be used for compensating the chromatic dispersion of, e.g., a long span of transmission fiber. Typically, such a module provides a fixed amount of dispersion (e.g. normal dispersion in the 1.6- μ m spectral region, with some wavelength dependence of the group delay dispersion), although tunable dispersion modules are also available. A module can easily be inserted into a fiber-optic link because it has fiber connectors for the input and output. The insertion losses may be significant, but may be compensated with a fiber amplifier, e.g. an erbium-doped fiber amplifier in a 1.5- μ m telecom system. A dispersion-compensating module is often placed between two fiber amplifiers.

The global Dispersion Compensation Fiber Modules market size was estimated at USD 76.8 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
