Abstracts

The disposable cytology brush is a single-use medical device designed for the collection and transfer of cellular samples from mucosal surfaces, primarily used in diagnostic procedures such as Pap smears, endobronchial brushing during bronchoscopy, and gastrointestinal tract sampling. It typically consists of a narrow, flexible shaft with bristles or a brush head at the distal end, engineered to gently exfoliate cells without causing significant tissue trauma, and is often packaged sterile to prevent contamination. The brush is discarded after one procedure to eliminate cross-contamination risks, ensure sample integrity, and comply with infection control standards, making it an essential tool in cytopathology and minimally invasive diagnostic workflows.

The global Disposable Cytology Brush market size was estimated at USD 128.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.25% during the forecast period.
